

PF Setup for Enterprise Environment

Setup PF in your environment. Below will show you where to place the files. What to change in each file to use in your environment.

1. Where you copy the files?
 - a. `com.apple.psuiss.plist` → `/Library/LaunchDaemons/com.apple.psuiss.plist`
 - b. `psuiss` folder → `/Library/psuiss`
 - c. `psuiss.sh` → `/etc/psuiss.sh`
2. Once you copy these files into place. You will need to run two command to make sure everything will launch properly.
 - a. `sudo chown -R root:wheel /Library/LaunchDaemons/com.apple.psuiss.plist`
 - a. This will change the ownership of the plist to system
 - b. `Sudo chmod +x /etc/psuiss.sh`
 - a. This will make the psuiss.sh executable
3. If you are testing rules that you add into the `/Library/psuiss/pf/` folder. You will need these commands to load and unload the LaunchDaemon.
 - a. `sudo launchctl unload /Library/LaunchDaemons/com.apple.psuiss.plist`
 - b. `sudo launchctl load /Library/LaunchDaemons/com.apple.psuiss.plist`
4. In the `/Library/psuiss/pf/` folder are a list of files that contain the rulesets you will need to add/change to accommodate to your environment.

DISCLAIMER

1. I did not create the original `.sh` or the `/pf/` files. These were taken from the IceFloor app. All ownership belongs to them.
2. I do not take any liability in how your environment will react to these commands. You install/run them at your discretion.
